

## Thunderstorm/Lightning Facts & Safety Tips

*Lightning Safety Week: June 18-24, 2017*

### Thunderstorm/Lightning Facts

Summertime is the peak season for one of the nation's deadliest weather phenomena – lightning. According to the National Weather Service, lightning kills an average of 49 people in the United States every year.

Unlike other weather hazards that often involve sophisticated watches and warnings from the National Weather Service, lightning can occur anywhere there is a thunderstorm – which is why the NWS conducts annual campaigns to educate the public about lightning risks.

In 2016, there were **38** lightning fatalities in a total of 17 states. An 8-year-old boy from Coshocton, Ohio was fatally struck by lightning on August 10, as he was sheltering horses.

Of the 38 lightning-strike fatalities:

- All of the incidents occurred outside.
- 29 were male; nine female. The youngest: a 5-year-old boy.
- Seven deaths occurred near or under a tree.

While most lightning casualties occur at the beginning of an approaching storm, a significant number of lightning deaths occur after the thunderstorm has passed. If thunder is heard, then the storm is close enough for a lightning strike. It is important to seek safe shelter immediately.

### Watch for Developing Thunderstorms

Thunderstorms are most likely to develop on spring or summer days but can occur year round. As the sun heats the air, pockets of warmer air start to rise and cumulus clouds form. Continued heating can cause these clouds to grow vertically into towering cumulus clouds, often the first sign of a developing thunderstorm.

#### **How far away was that lightning?**

The sound of thunder travels about one mile every 5 seconds. If you count the seconds between the flash of lightning and the crack of thunder, and divide by 5, you get the number of miles the lightning is from you (10 seconds is 2 miles)

## Know Lightning Safety

There is no safe place outside when thunderstorms are in the area. If you hear thunder, you are likely within striking distance of the storm. Just remember: ***When thunder roars, go indoors!***

The best way to protect yourself and others from lightning or any severe storm is to avoid the threat. Have a lightning safety plan. Cancel or postpone outdoor activities early, if thunderstorms are expected. Monitor weather conditions and get to a safe place before the weather becomes threatening. Substantial buildings and hard-topped vehicles are safe options. Rain shelters, small sheds and open vehicles are not safe.

## What You Need to Know

- There is ***No Safe Place*** outside when thunderstorms are in the area.
- If you hear thunder, lightning is close enough to strike you.
- When you hear thunders, *immediately* move to safe shelter such as a substantial building with electricity or plumbing enclosed, or a metal-topped vehicle with the windows up.
- Stay in safe shelter for at least 30 minutes after hearing the last sound of thunder.

## Indoor Lightning Safety

- Stay off corded phones, computers and other electrical equipment that put you in direct contact with electricity.
- Avoid plumbing, including sinks, baths and faucets.
- Stay away from windows and doors, and stay off porches.
- Do not lie on concrete floors, and do not lean against concrete walls.

## Last Resort Outdoor Risk Reduction Tips

If you are caught outside with no safe shelter anywhere nearby, the following actions may reduce your risk of lightning strike:

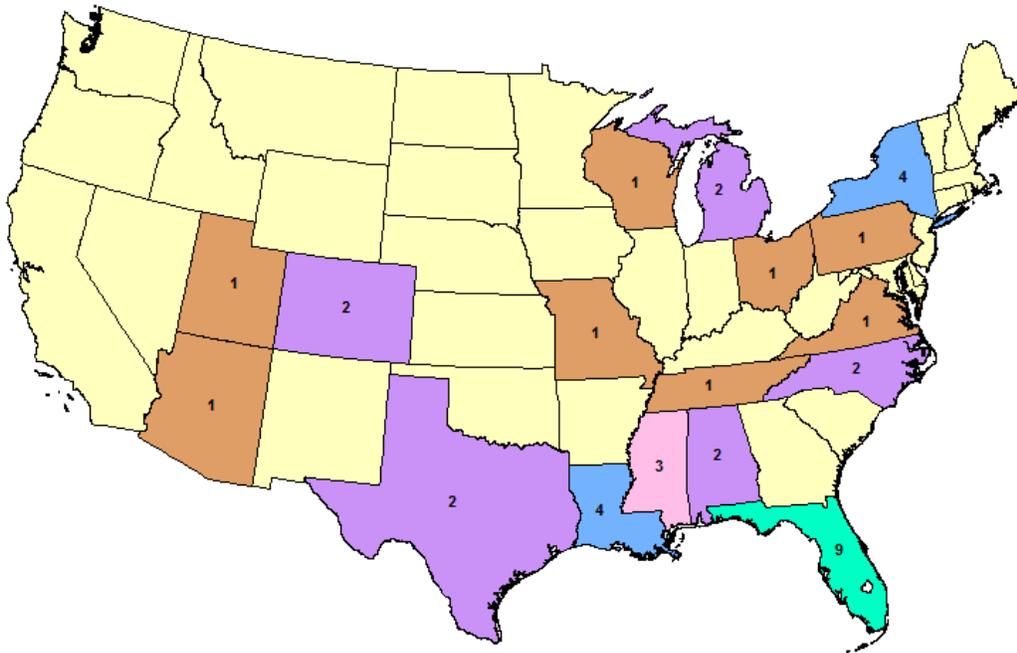

- Immediately get off elevated areas such as hills, mountain ridges or peaks.
- Never lie flat on the ground.
- Never shelter under an isolated tree.
- Never use a cliff or rocky overhang for shelter.
- Immediately get out and away from ponds, lakes, pools, and other bodies of water.
- Stay away from objects that conduct electricity (barbed wire fences, power lines, windmills, etc.)

**Protect your pets.** Outside dog houses are not lightning-safe. Dogs that are chained to trees or wire runners can easily fall victim to lightning strikes. Consider bringing your pets inside the home or garage during thunderstorms.

## Helping a Lightning-Strike Victim

If someone is struck by lightning, call 911 and seek immediate medical attention. Lightning victims do not carry an electrical charge and are safe to touch. Knowing first aid measures, which include cardiopulmonary resuscitation (CPR), can help lightning-strike victims survive. American Red Cross chapters and local fire departments often offer first aid and CPR classes.

## Homeowners' insurance claims and lightning payout losses

According to the Insurance Information Institute, the total number of lightning-related homeowners insurance claims were down slightly in 2015, but rose in severity by 7 nearly percent.

- \$790 million in lightning claims was paid out in 2015 to nearly 100,000 policyholders
- The average lightning claim paid was 7.4 percent more than in 2014: \$7,947 in 2015 vs. \$7,400 in 2014
- Florida, Georgia, Texas and Louisiana remain top states for lightning claims
